

Logical sequence

1. Onload browser: loadCalendar.
2. loadCalendar function => Call create calendar function of the current year.

 if localStorage !undefined => loop over ti to pick up the events to our actual calendar

Stablish reminder for all the events not finished yet or with endDate not null

 if doesn't exist, create new calendar (it's created in the first statement of the function, **not else statement needed**)

3. Display Calendar Interface function (paint the calendar in the browser)

 All months and play with hide show display?

 Month by index??

How to manage the first day painting on the month?

Get the first day of the month and the `getDay()` to return the weekday.

```
first column to paint the first day with firstDayMonth.getday()  
function
```

4. Buttons next and previous month:

 call display function?

 toggle with hide and show?

5.
